

Evidence-grounded, version-aware theorem infrastructure

1

SOURCE + VERSION

identity before interpretation

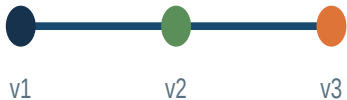

PaperVersion

Paper / PDF

source file + access tier

lineage

preprint - conference - journal
correction / retraction events

hash: 848f00c3...595cf

identity check [OK]

2

EVIDENCE BINDING

field-level pointers

EvidencePointer

exact source binding

label Theorem 14
page 12
section 5 Algorithm
span extracted text range
hash source SHA-256

grounded fields

scope, bound, probability
each keeps its own pointer

3

SCOPE RECORD

unknowns stay explicit

ScopedTheorem

formal scope contract

fragment

roles

regime

resources

randomness

result kind

missing axes -> UNKNOWN

promotion requires source access
and field-level review

4

QUALIFIED GRAPH

relations after review

TypedRelation

qualified graph edge

subsumes / conflicts with
strengthens / uses technique
scope preconditions + evidence

Researcher query

find constant-delay results
under the same query scope

relations are inferred last

similarity never implies proof

PROMOTION GATE

access check

identity check

field review

sign / reject

unresolved values remain explicit

no silent completion

source evidence / scope preservation / version lineage / qualified relations
